ABSTRACT OF THE DISCLOSURE

To provide a hydrogen absorbing alloy having a BCC (body-centered cubic structure) as a crystal structure, and particularly a hydrogen-absorbing alloy for a nickelhydride cell having excellent discharge capacity and durability (cycle characteristics), said hydrogenabsorbing alloy having a composition expressed by the general formula Ti(100-a-b-c-d)CraVbNicXd, where X is at least one member selected from the group consisting of Y (yttrium), lanthanoids, Pd and Pt, and each of a, b, c and d is represented, in terms of at%, by the relations $8 \le a$ \leq 50, 30 < b \leq 60, 5 \leq c \leq 15, 2 \leq d \leq 10 and 40 \leq a + b + $c + d \le 90$, wherein the crystal structure of a principal phase is a body-centered cubic structure, and further, the alloy contains at least one of Mo and W in place of V and at least one member selected from the group consisting of Y (yttrium), lanthanoids, Pd and Pt, and its crystal structure is converted to the body-centered cubic structure by heat-treatment.
